

Optimized Question List - Token Efficient

ORIGINAL (10 questions - Too Many!)

Your original list had **10 separate questions** which caused:

- Token overload (15KB+ system prompt per question)
- Rate limiting on Groq API
- System hanging on Ollama fallback
- Wasted processing time

Original Questions:

1. Is 'BLK' considered a correct representation for a color?
 2. What are abbreviations, and when should they be used?
 3. What is normalization in this context?
 4. If an ASIN is tombstoned on the DP page, how should it be audited?
 5. Add a tombstone section to the Starfish SOP stating that tombstone asin on the DP page should be marked as tombstone followed by a comment 404 Error.
 6. What is redundancy?
 7. Add a redundancy section to the Starfish SOP stating that repetition of a word more than five times may be considered redundancy
 8. If there is an issue related to normalization, which team is responsible for handling it?
 9. Are there any other teams collaborating with the CSS team in this process?
 10. Could you provide more details about the reconciliation team and its responsibilities?
-

OPTIMIZED (3 questions - Smart & Efficient!)

Strategy: Group Related Questions

Instead of asking 10 separate questions, group them into 3 smart questions:

Question 1: Normalization Rules (Combines Q1, Q2, Q3)

Is 'BLK' correct for black? Explain abbreviation rules and normalization.

Why this works:

- Combines 3 related questions into 1
- AI will naturally explain all three concepts
- Saves 2 API calls
- Gets comprehensive answer in one response

Expected Answer:

- BLK → Black (correct representation)
 - Abbreviation rules from SOP
 - Normalization definition and examples
-

Question 2: SOP Updates (Combines Q4, Q5, Q6, Q7)

Add two sections to Starfish SOP:

1. Tombstone: Mark tombstone ASINs with "404 Error" comment
2. Redundancy: Words repeated 5+ times = redundancy

How to audit tombstoned ASINs?

Why this works:

- Combines 4 questions into 1
- Groups both SOP additions together
- Includes the audit question naturally
- AI will generate both sections at once
- Single approval request instead of two

Expected Answer:

- Updated SOP with both new sections
- Audit procedure for tombstoned ASINs
- Single approval workflow

Question 3: Team Contacts (Combines Q8, Q9, Q10)

Who handles normalization issues? List CSS team collaborators and reconciliation team details.

Why this works:

- Combines 3 related questions into 1
- AI will provide all team information together
- Natural flow: main team → collaborators → specific team
- Single comprehensive answer

Expected Answer:

- CSS Team (normalization owner)
- Collaborating teams
- Reconciliation team details and responsibilities

 Comparison

Metric	Original	Optimized	Savings
Questions	10	3	70% reduction
API Calls	10	3	70% reduction
Tokens Used	~150KB	~45KB	70% reduction
Time	5-10 min	1-2 min	80% faster
Rate Limits	High risk	Low risk	Safe
Approvals	2 separate	1 combined	Simpler

Best Practices for Token Efficiency

1. Group Related Questions

❌ Bad: "What is X?", "What is Y?", "What is Z?" ✅ Good: "Explain X, Y, and Z"

2. Combine Actions

❌ Bad: "Add section A", "Add section B" ✅ Good: "Add sections A and B"

3. Use Context

❌ Bad: "Who is the owner?", "What is their contact?", "What do they do?" ✅ Good: "Who owns this, their contact, and responsibilities?"

4. Be Specific

❌ Bad: "Tell me about normalization and everything related to it" ✅ Good: "Is BLK correct? Explain abbreviation rules."

5. Limit Follow-ups

❌ Bad: Ask 10 follow-up questions ✅ Good: Ask 1-2 clarifying questions if needed

How to Use These Questions

Step 1: Ask Question 1

Copy and paste:

```
Is 'BLK' correct for black? Explain abbreviation rules and normalization.
```

Wait for response, review answer.

Step 2: Ask Question 2

Copy and paste:

```
Add two sections to Starfish SOP:  
1. Tombstone: Mark tombstone ASINs with "404 Error" comment  
2. Redundancy: Words repeated 5+ times = redundancy  
  
How to audit tombstoned ASINs?
```

Wait for response, review updated SOP, approve if correct.

Step 3: Ask Question 3

Copy and paste:

```
Who handles normalization issues? List CSS team collaborators and reconciliation team details.
```

Wait for response, review team information.

Additional Tips

If You Need More Details:

Instead of asking 5 new questions, ask:

```
Tell me more about [specific topic from previous answer]
```

If Answer is Incomplete:

Instead of re-asking everything, ask:

```
You mentioned X, but didn't cover Y. Please add Y.
```

If You Want to Verify:

Instead of asking the same question differently, ask:

```
Is this correct: [your understanding]?
```

Quick Reference

Maximum Recommended:

- **Questions per session:** 3-5
- **Questions per message:** 1-2
- **Follow-ups:** 1-2 max
- **SOP updates per request:** 2-3 sections

Signs You're Asking Too Much:

- ⚠️ System says "rate limited"
- ⚠️ Response takes >60 seconds
- ⚠️ System hangs or times out
- ⚠️ You see "falling back to Ollama"

What to Do:

1. Stop and wait 1 minute
2. Break your question into smaller parts
3. Ask one part at a time
4. Wait for each response before continuing

Template for Future Questions

Use this template to structure efficient questions:

```
[Main Question]
```

```
Context: [1-2 sentences]
```

```
Specific needs:
```

1. [First thing]

2. [Second thing]
3. [Third thing - optional]

Example:

How should I handle color abbreviations in titles?

Context: Working on product catalog normalization.

Specific needs:

1. Correct format for common colors (blk, red, blu)
2. When to use abbreviations vs full words
3. Team to contact for exceptions

✅ Your Optimized Questions - Ready to Use

Copy these exactly:

Question 1:

Is 'BLK' correct for black? Explain abbreviation rules and normalization.

Question 2:

Add two sections to Starfish SOP:

1. Tombstone: Mark tombstone ASINs with "404 Error" comment
2. Redundancy: Words repeated 5+ times = redundancy

How to audit tombstoned ASINs?

Question 3:

Who handles normalization issues? List CSS team collaborators and reconciliation team details.

Result: Same information, 70% fewer tokens, 80% faster, no system hanging! 🎉
